Target Lesion
Flush RCA, 30mm occlusion

Methodology
Primary retrograde approach; after Corsair failed to track tortuous septal anatomy, BTG MicroCross™ 14 microcatheter was introduced and tracked over Sion™ guidewire to the distal cap.
Distal cap was crossed using Gaia™ 3rd guidewire, followed by Reverse CART to externalize retrograde guidewire.
Upon guidewire externalization, successful revascularization was performed using 3 Synergy DES.

Approach
Retrograde, Reverse CART
